

JARVIS

Good, this is very clear. I'll rewrite **your entire Jarvis plan** end-to-end, including:

- Complete job-application package (with your daily schedule rules).
- Complete connection/relationship package.
- Startup idea engine + build-and-pitch loop.
- Rides bot.
- Freelance.
- All the unique private/public features you accepted (morning show, story review, etc.).

Treat this as your **spec document**.

1. High-Level: Two Faces of Jarvis

Private Jarvis – “Operator Mode”

- Runs on your real accounts: Gmail, Calendar, LinkedIn, job boards, WhatsApp, etc.
- Entry point: mainly Telegram + WhatsApp (for rides), later anything else you want.
- Goal: **run your career and life like an OS**, not just answer questions.

Public Jarvis – “Stage Mode”

- Lives on your portfolio site.
 - Uses only dummy/synthetic data, mock tools, and sandboxed browsing.
 - Goal: **show recruiters how the real system works** (agentic loops, job automation, startup engine, rides, freelance) without touching private data.
-

2. Private Jarvis – Job Application Package (Your Detailed Rules)

2.1 Daily Job Search Theme

You define a **weekly pattern**; Jarvis respects it automatically:

- Day 1: Mid-size companies.
- Day 2: University / campus / research jobs.
- Day 3: State / government / public sector jobs.
- Day 4: MNCs / big tech / large product companies.
- Day 5+: You can continue the theme (startups only, remote only, etc.) or repeat.

Jarvis knows **which day it is** and automatically targets the correct category.

2.2 Daily Target: ~50 Applications

Every day, Jarvis aims to **find and prepare** at least around **50 opportunities** (across that day's category) with:

For each job:

1. Job Match Check

- Parse job description.
- Compare to your skills, experience, preferences.
- Add a simple "Fit Rating" (e.g., Strong / Medium / Weak) with a short explanation.

2. Resume Edit

- Generate a **tailored resume snippet or full version** for that job:
 - Highlight relevant projects, skills, and keywords.
 - Optionally maintain multiple resume variants for different tracks (backend, data, AI, agents).

3. Cover Letter / Application Message

- For each role, generate a **custom cover letter** or "Why me" paragraph.
- Ready to paste into Workday/Greenhouse/LinkedIn forms.

4. Connection Strategy + Messages

For each company, Jarvis looks for:

- Possible connections:
 - Alumni, employees in similar roles, managers, recruiter profiles.
- For each connection, it prepares:
 - A personalized LinkedIn connection message or email to send.

- Different message templates for:
 - “Referral ask,”
 - “Informational chat,”
 - “Show them your project/Jarvis.”

5. Execution Mode

You can pick how aggressive it is:

- **Semi-auto:**
 - Jarvis gives you a list of jobs + resumes + messages; you confirm which to apply/send.
- **Mostly auto (you’re okay with this):**
 - Jarvis applies on your behalf and sends connection messages, following rules you define (e.g., skip obvious spam / low-fit roles).
 - Logs everything so you can review:
 - Jobs applied,
 - Resume version used,
 - Connection messages sent.

Jarvis’s goal: **50 applications/day**, *with quality* (tailored, connections included), not just dumb spam.

3. Private Jarvis – Connection / Relationship Package

Jarvis manages **two levels of connections**:

3.1 Application-Specific Connections

For each job (as above):

- Find relevant people (engineers, hiring managers, alumni, recruiters).
- Generate **personalized outreach** referencing:
 - Their role, your relevant work, and why you like the company.
- Optionally send those messages automatically once you approve the style/rules.

3.2 Ongoing “Inner Circle” Engine (Long-Term Network)

Independently of job search:

- Maintain lists:
 - Friends, Mentors, Recruiters, Founders, Ex-colleagues, Potential collaborators.
- Track:
 - Last contact date, context, shared topics (e.g., “loves AI agents,” “met at hackathon”).

Every week:

- Pick 3–5 people who are due for a touchpoint.
- Suggest **high-signal reasons** to reach out:
 - “Share your new Jarvis feature,”
 - “Ask how their new role at X is going,”
 - “Send them a short Loom of your portfolio.”

Generate drafts for each (WhatsApp/Telegram/LinkedIn/email) and either:

- You send manually, or
- Jarvis sends via allowed channels (where safe).

4. Private Jarvis – Startup & Product Idea Engine

This is your **career-growth weapon**: Jarvis studies companies and generates **unique idea pitches** you can build and send to founders.

4.1 Target Sources

Every day or on schedule, Jarvis looks at:

- Startups (Seed/Series A/B).
- Product-based companies.
- Early-stage teams and new launches.

It checks:

- What products/features they’re building.
- Pain points from:
 - Their site,
 - Job descriptions,

- Blog posts,
- Public support pages,
- Social hints (optional).

4.2 Idea Synthesis

For each interesting company, Jarvis:

1. Identifies **gaps or opportunities**:

- Internal dev tools that seem missing.
- Automations they likely don't have (e.g., support triage, lead scoring).
- Small features that could add a lot of value.

2. Proposes **concrete, buildable ideas** that you can ship:

- Example:
 - “For X, build a lead-qualification bot that integrates with their stack (HubSpot, Intercom, etc.) and automatically tags opportunities.”
- These ideas are designed to be:
 - Small enough for you to build solo.
 - Impressive enough to show to founders.

3. Generates a **mini spec** per idea:

- Problem summary.
- Proposed solution.
- High-level architecture (APIs, tools, flows).
- 1–2 mock screens or UX flows (described in text or diagrams).

4.3 Pitch & Build Loop

For each idea you like:

- Jarvis helps you **build the MVP plan**:
 - Tech stack, milestones (v0, v0.1, etc.), what to show first.
- Once you build it (or even partly build), Jarvis prepares **founder outreach**:
 - Email / DM that says:

- “I noticed you do X, I built this small Y that could help. Here’s a demo link + GitHub.”
- Tailored variant for each founder/company.

This system is directly tied to **your career growth**: not just job applications, but “I built things *for you*” pitches.

5. Private Jarvis – Rides Bot

You already built a **WhatsApp rides bot**; Jarvis treats it as one of your agents.

5.1 Behavior

- Monitors a specific WhatsApp group (e.g., “Rides” group).
- Detects messages like:
 - “Need a ride,” “Anyone going to X,” etc.

When it sees a ride request:

- Privately messages that user:
 - “Hey, where are you going from and to?”
 - “What time?”
 - “Any constraints?”

Then it can:

- Log the request for you.
- Optionally try to match riders (if you extend it).
- Or just ensure you never miss ride opportunities/messages.

5.2 Jarvis Integration

- Jarvis’s **daily summary** can include:
 - “Rides activity today: 3 requests seen, you responded to 2,” etc.
 - For public demo, you can show a **mock rides scenario** as part of your “Day in the Life” simulation.
-

6. Private Jarvis – Freelance Package

Your freelance side is driven by Jarvis:

- Finds or organizes leads:
 - Local businesses (coffee shops, clinics),
 - Online founders,
 - Existing contacts who might need automations.
- For each potential client, Jarvis:
 1. Analyses the business (from public signals).
 2. Proposes **an automation/AI project** they'd benefit from (e.g., appointment reminders, review requests, internal dashboards).
 3. Generates:
 - A short audit of their current workflow ("You probably do X manually").
 - A "proposal" section:
 - Scope, timeline, price range, expected impact.
 - Draft outreach message or Upwork/LinkedIn proposal.
- Over time, tracks:
 - Who responded,
 - Who converted into a client,
 - What to follow up on.

7. Private Jarvis – Unique “Life OS” Features You Accepted

These make the private system **exciting and not boring**.

1. Morning Briefing Show

- Daily: Today's mission, your priorities, mood check, and one micro-quest.

2. Story Mode Weekly Review

- Weekly: A “series episode” that narrates your week as a story across jobs, learning, money, health, projects.

3. What-If Simulator

- For big decisions (job vs freelance, company A vs B), Jarvis simulates multiple timelines (money/skills/stress/portfolio) and gives you different futures to compare.

4. **Inner Circle Social Engine**

- Keeps your network warm; each week, picks a few contacts and suggests high-quality, personalized messages to send.

5. **Learning Arena**

- Daily learning card → small topic, resource, quiz; XP per skill area and weekly skill progress summary.

6. **Autopilot Routines**

- Daily small run:
 - Suggests jobs to apply, outreach to send, learning tasks, and logs your approvals/rejections to learn your preferences.

All of this **sits on top of** your job/startup/freelance/memory/rides core.

8. **Public Jarvis – Demo Version of All This**

Public Jarvis is a **safe mirror** of your system, for your portfolio.

8.1 **Core Public Behaviors**

- Uses **mock data** and synthetic personas (Job Hunter / Founder / Café Owner / Student).
- For each feature:
 - Jobs:
 - Shows how it would generate 50 tailored applications (but only displays a subset + fake details).
 - Startups:
 - Shows how it would research companies and propose unique ideas.
 - Freelance:
 - Demo: “My Coffee Shop” → generates automation strategy live.
 - Rides:

- Demo scenario where someone posts “Need a ride,” and Jarvis shows its private reply flow.
- Safety:
 - Strict rate limiting per visitor.
 - PII redaction in all outputs.
 - Sandbox browser for “check this website” requests.

8.2 Stagehand Personality (Unique Angle 2)

Public Jarvis always talks like a **narrator of the real system**:

- “In Akhil’s private Jarvis, this step would now:
 - Find 50 real jobs,
 - Tailor resumes,
 - Auto-apply and send connection messages.
 In this demo, I’ll show you 3 examples with dummy data.”

This makes your demo honest and impressive.

8.3 Jarvis Observatory / Log View (Unique Angle 3)

Your portfolio UI shows for each interaction:

- Thinking → Agent Routing → Actions → Generation.
- Which agent got called (Jobs / Startup / Freelance / Rides).
- What mock tools were used.
- Optional fun metrics: “steps taken,” “tokens,” etc. (all safe/fake).

This visualizes **agentic loops and system design**, not just text.

8.4 Day in the Life Simulator (Unique Angle 5)

A button like “**Simulate Akhil’s Mock Monday**”:

- Walks through:
 - Morning briefing,
 - Job search and applications,
 - Startup idea scanning and pitch creation,
 - Rides bot handling a sample ride request,
 - Freelance outreach idea,

- Short story-style recap.
